

SCIENCE OLYMPIAD 2011/2012 ST. JOE'S INVITE

THERMODYNAMICS

Team: Key

Team Number: _____

Team Member Names: 1. _____

2. _____

Instructions: This test contains two parts. Part I contains 10 questions and Part II contains 5 questions. Answer all questions on the test paper. If you need more room, you may attach extra paper.

Each question in Part I is worth 1.5 points. Each question in Part II is worth 7 points. The test is worth a total of 50 points. Show all work for Part II. Partial credit will be given. Answers without accompanying work will receive little credit.

An appendix is attached to this test. This information may be required to answer some of the questions on this test.

You may not finish the test in the allotted time. Therefore, you are encouraged to complete the questions in any order that you choose.

Part I

1. The state of a pure, compressible system is completely satisfied by how many independent, intensive properties? 2
2. In a thermodynamic system, where does energy transfer occur?
Boundaries
3. At the Critical Point the saturated liquid and saturated vapor states are identical.
4. What type of energy is associated with intermolecular forces and is influenced by the spacing between molecules (gas vs. liquid vs. solid)?
Latent
5. The state of a system depends on the path taken to reach that state. (True/False) False
6. A turbine extracts work out through having a high pressure fluid at the inlet convert to a low pressure fluid at the outlet.

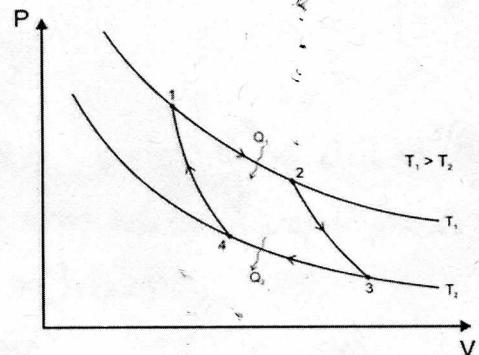

7. Label the 4 processes for a Carnot cycle:

1-2: Isothermal Heating (Expansion)

2-3: Adiabatic Expansion

3-4: Isothermal cooling (compression)

4-1: Adiabatic Compression

8. The ideal gas equation of state is valid under low pressures and high temperatures relative to critical point properties.

9. A reversible process will always have a higher efficiency than an irreversible one.

10. Which of the following is not a law of thermodynamics?

- If two systems are in thermal equilibrium with a third system, they are also in thermal equilibrium with each other.
- Energy can be transformed, but not created nor destroyed.
- Mass can be neither created nor destroyed.
- Energy has a natural tendency to become more disordered.

Part II

1. Both a gage and a manometer are attached to a gas tank to measure its pressure. If the reading on the pressure gage is 80 kPa, determine the distance between the two fluid levels of the manometer if the fluid is mercury (density $\rho = 13,600 \text{ kg/m}^3$).

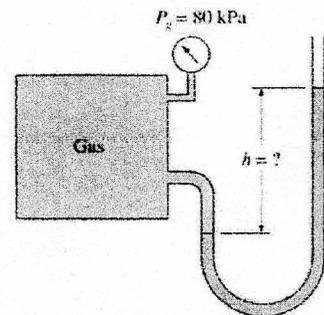

Manometer fluid in equilibrium \Rightarrow pressure on gas by liquid = pressure of liquid on gas
Hydrostatic pressure: $P = \rho gh$

$$\text{So } P_g = \rho gh.$$

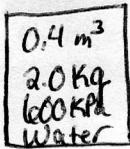

$$P_g = 80 \text{ kPa} = 80,000 \text{ Pa}$$

$$80,000 \text{ Pa} = 13,600 \frac{\text{kg}}{\text{m}^3} \cdot 9.81 \text{ m/s}^2 \cdot h$$

$$h = 0.600 \text{ m}$$

2. A vessel having a volume of 0.4 m^3 contains 2.0 kg of a liquid and water vapor mixture in equilibrium at a pressure of 600 kPa . Find the volume and mass of both the liquid and the vapor.

Find specific volume of liquid + vapor at this pressure using table A5.

$$\text{liquid: } v_f = 0.001101 \text{ m}^3/\text{kg}$$

$$\text{vapor: } v_g = 0.31560 \text{ m}^3/\text{kg}$$

Find specific volume of this mixture: $v = \frac{0.4 \text{ m}^3}{2.0 \text{ kg}} = 0.2 \text{ m}^3/\text{kg}$

Now, calculate quality (percentage of mixture that exists in vapor phase):

$$x = \frac{v - v_f}{v_g - v_f} = \frac{0.2 \text{ kg/m}^3 - 0.001101 \text{ kg/m}^3}{0.31560 \text{ kg/m}^3 - 0.001101 \text{ kg/m}^3} = 0.6324$$

Use quality to calculate mass of liquid + vapor:

$$m_f = (1 - 0.6324)(2.0 \text{ kg}) = \boxed{0.735 \text{ kg}} \quad (\text{mass of liquid})$$

$$m_g = 0.6324(2.0 \text{ kg}) = \boxed{1.26 \text{ kg}} \quad (\text{mass of vapor})$$

Use mass + specific volume to calculate volume:

$$V_f = m_f v_f = 0.735 \text{ kg} \cdot 0.001101 \text{ m}^3/\text{kg} = \boxed{8.09 \times 10^{-4} \text{ m}^3} \quad (\text{volume of liquid})$$

$$V_g = m_g v_g = 1.26 \text{ kg} \cdot 0.31560 \text{ m}^3/\text{kg} = \boxed{0.3977 \text{ m}^3} \quad (\text{volume of vapor})$$

3. Argon in the amount of 0.6 kg fills a 0.05 m^3 piston-cylinder device at 550 kPa . The piston is now moved by changing the weights until the volume is twice its original size. During this process the temperature is kept constant. Determine the final pressure in the device.

$$P_1 = 550 \text{ kPa}$$

$$V_1 = 0.05 \text{ m}^3$$

$$T_1 = T_2$$

$$P_2 = ?$$

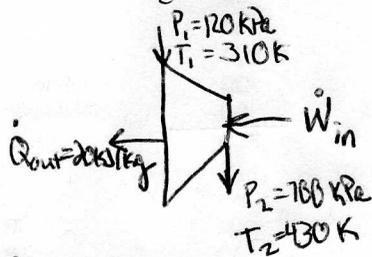

$$V_2 = 2V_1 = 0.1 \text{ m}^3$$

$$P_1 V_1 = P_2 V_2$$

$$550 \text{ kPa} \cdot 0.05 \text{ m}^3 = P_2 \cdot 0.1 \text{ m}^3$$

$$\boxed{P_2 = 275 \text{ kPa}}$$

4. Helium is to be compressed from 120 kPa and 310 K to 700 kPa and 430 K using a compressor. A heat loss of 20 kJ/kg occurs during the compression process. Neglecting kinetic energy changes, determine the power input required for a mass flow rate of 90 kg/min.

\dot{W}_{in} = power input
 \dot{Q}_{out} = heat loss
 \dot{m} = mass flow rate

$$\dot{m} = 90 \frac{\text{kg}}{\text{min}} = 1.5 \text{ kg/s}$$

Energy conservation (1st Law of Thermodynamics):

$$\dot{E}_{in} = \dot{E}_{out} \quad (\text{rate of energy supplied} = \text{rate of energy lost OR power supplied} = \text{power lost})$$

$$\dot{W}_{in} + \dot{m}h_1 = \dot{Q}_{out} + \dot{m}h_2$$

$$h = C_p T, \text{ so}$$

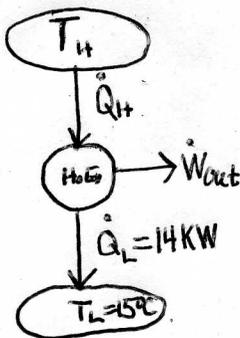

$$\dot{W}_{in} + \dot{m}C_p T_1 = \dot{Q}_{out} + \dot{m}C_p T_2$$

$$\text{From table A2, } C_p = 5.1926 \frac{\text{kJ}}{\text{kgK}}$$

$$\dot{W}_{in} + 1.5 \frac{\text{kg}}{\text{s}} \cdot 5.1926 \frac{\text{kJ}}{\text{kgK}} \cdot 310 \text{ K} = 20 \frac{\text{kJ}}{\text{kg}} + 1.5 \frac{\text{kg}}{\text{s}} \cdot 5.1926 \frac{\text{kJ}}{\text{kgK}} \cdot 430 \text{ K}$$

$$\boxed{\dot{W}_{in} = 955 \text{ kW}}$$

5. A heat engine is operating on a Carnot cycle and has a thermal efficiency of 75%. The waste heat from this engine is rejected to a nearby lake at 15°C at a rate of 14 kW. Determine the power output of the engine and the temperature of the source, in °C.

$$\text{Thermal efficiency: } \eta_{TH} = 1 - \frac{T_L}{T_H}$$

$$0.75 = 1 - \frac{288 \text{ K}}{T_H}$$

$$T_H = 1152 \text{ K} = \boxed{879^\circ \text{C}}$$

$$\eta_{TH} = 1 - \frac{\dot{Q}_L}{\dot{Q}_H}$$

$$0.75 = 1 - \frac{14 \text{ kW}}{\dot{Q}_H}$$

$$\dot{Q}_H = 56 \text{ kW}$$

Conservation of Energy: $\dot{E}_{in} = \dot{E}_{out}$

$$\dot{Q}_H = \dot{W}_{out} + \dot{Q}_L$$

$$\dot{W}_{out} = \dot{Q}_H - \dot{Q}_L = 56 \text{ kW} - 14 \text{ kW}$$

$$\boxed{\dot{W}_{out} = 42 \text{ kW}}$$

Hints:

1. Hydrostatic Pressure (Pressure by liquid due to gravity) $P = \rho g h$

2. Quality (percentage of mixture that is vapor):

$$x = \frac{v - v_f}{v_g - v_f} \quad (\text{Use table A4 or A5})$$

3. $P_1 V_1 = P_2 V_2$

4. $\dot{E}_{in} = \dot{W}_{in} + \dot{m} h_1$

$\dot{E}_{out} = \dot{Q}_{out} + \dot{m} h_2$

Enthalpy $h = c_p \cdot T$ (table A2)

5. Thermal efficiency:

$$\eta_{TH} = 1 - \frac{T_c}{T_h}$$

$$\eta_{TH} = 1 - \frac{Q_c}{Q_h}$$

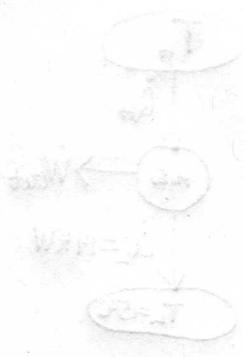

$\dot{W}_{out} = 100 \text{ kW}$

$T_c = 100 \text{ K} = 80 \text{ }^\circ\text{C}$

$\eta_{TH} = 1 - \frac{T_c}{T_h} = 0.75 = 1 - \frac{100}{T_h}$

$T_h = 200 \text{ K}$

Conservation of Energy: $\dot{E}_{in} = \dot{E}_{out}$

$\dot{Q}_{in} = \dot{Q}_{out} + \dot{W}_{out}$

$50 \text{ kW} = 50 \text{ kW} - 100 \text{ kW}$

$\dot{W}_{out} = 100 \text{ kW}$

TABLE A-2

Ideal-gas specific heats of various common gases

(a) At 300 K

Gas	Formula	Gas constant, R kJ/kg·K	c_p kJ/kg·K	c_v kJ/kg·K	k
Air	—	0.2870	1.005	0.718	1.400

Source: Tables A-4 through A-8 are generated using the Engineering Equation Solver (EES) software developed by S. A. Klein and F. L. Alvarado. The routine used in calculations is the highly accurate Steam_IAPWS, which incorporates the 1995 Formulation for the Thermodynamic Properties of Ordinary Water Substance for General and Scientific Use, issued by The International Association for the Properties of Water and Steam (IAPWS). This formulation replaces the 1984 formulation of Haar, Gallagher, and Kell (NBS/NRC Steam Tables, Hemisphere Publishing Co., 1984), which is also available in EES as the routine STEAM. The new formulation is based on the correlations of Saul and Wagner (J. Phys. Chem. Ref. Data, 16, 893, 1987) with modifications to adjust to the International Temperature Scale of 1990. The modifications are described by Wagner and Pruss (J. Phys. Chem. Ref. Data, 22, 783, 1993). The properties of ice are based on Hyland and Wexler, "Formulations for the Thermodynamic Properties of the Saturated Phases of H₂O from 173.15 K to 473.15 K," ASHRAE Trans., Part 2A, Paper 2793, 1983.
