

## Thermodynamics Pre-Nationals Exam II

Partial credit may be given where work is shown. **Give all answers to three significant figures.**

### 1) Water

- a. What purpose do water baths usually serve in thermodynamics? [1]
- b. What property of water allows it to serve this purpose? [1]
- c. Describe the water-involving experiment which originally proved that mechanical energy could be converted to thermal energy? Also, give the scientist, and the year of this experiment. [4]
- d. Liquid water reaches peak density at what temperature? The non-polar n-octane has boils at  $125^{\circ}\text{C}$  and melts at  $-57^{\circ}\text{C}$ , at what temperature does it reach peak density. Explain why water's peak density is not  $0^{\circ}\text{C}$ . [4]

### 2) Adiabatic Processes

- a. Adiabatic processes meet what restriction. [1]
- b. A reversible, adiabatic process can also be called what? [1]
- c. If a process undergoes an adiabatic expansion, which of the following increase, and which decrease? U, P, V, T, H, S [6]

d. Draw a reversible adiabat on both a PV diagram and a TS diagram. On the PV diagram, also draw in isotherms. [4]

e. Give two practical way of making a process adiabatic. [2]

3) Calorimetry

a. 3.2kg of water are in a .89kg aluminum pot, which is thermally isolated from its surroundings and at  $23.2^{\circ}\text{C}$ . A .3kg copper bar is dropped in at  $346^{\circ}\text{C}$ . What temperature is the water after the system reaches equilibrium? [4]

b. After the events described above, the copper bar is removed from the system. Describe what happens, with all relevant calculations. [2]

c. Describe the design of a bomb calorimeter. What do people use it for? [2]

4) Chemistry

a. Using standard entropies and heats of formation, compute the change in enthalpy and change in free energy for the combustion of butane ( $C_4H_{10}$ ). combustion reactions of hydrocarbons form  $CO_{2(g)}$  and  $H_2O_{(g)}$ . [6]

5) Processes

a. A monatomic, ideal gas at  $0^\circ C$  and 1atm occupies 57.3L. It expands isothermally to 4 times its volume, is then compressed isobarically to its original volume, after which it is returned to its original temperature, isochorically. Calculate  $\Delta U$ ,  $q$ , and  $w$  for 1 cycle. Pay attention to the signs. [8]

b. Determine whether  $\Delta U$ ,  $q$ , and  $w$  would increase, decrease, or stay constant if the gas were diatomic. [4]

- 6) Using the example of a rectangular prism of width  $x$ , height  $y$ , and depth  $z$ , derive the approximate relationship between the coefficient of linear expansion and the coefficient of volumetric expansion. Under what conditions does this approximation break down? Work must be shown. [8]

- 7) The laws of thermodynamics: Identify each sentence as an expression of the laws of thermodynamics, by number. [8]
- Any non-crystalline substance will always have entropy.
  - The universe tends to proceed in the direction that increases disorder.
  - Temperature is the only variable needed to determine if two objects are in thermal equilibrium
  - Internal energy is a state function
  - $\Delta S \geq 0$
  - If A is in thermal equilibrium with B, and B with C, then A is in thermal equilibrium with C
  - Heat flows from areas of high temperature to areas of low temperature.
  - $\Delta U = q + w$
- 8) History of Thermodynamics
- Who is considered the father of statistical thermodynamics? [1]
  - What equation did he derive? Give the value of any constants, and identify all variables. [4]
  - On what significant object (to him) is that equation engraved? [1]
  -
